Nifty 50 & Bank Nifty

Intraday Options-Buying Strategy Portfolio

15 confidence-rated scalping strategies for algorithmic deployment · June 2026

Executive Summary

This report specifies fifteen intraday option-**buying** strategies for Nifty 50 and Bank Nifty, intended for fully automated execution. The mandate is strictly buying: single-leg long options and defined-risk debit spreads (a debit spread is net buying with one sold leg). The working capital base is fixed at ₹1,00,000, with profits swept out so the base resets after each profitable period; this caps compounding by design and matches the target of a steady **15–25% annual XIRR** rather than abrupt gains. Execution is automated through the Zerodha Kite Connect and Fyers v3 APIs behind one broker-agnostic layer.

Honest framing of the numbers

Win rate and reward-to-risk trade off against each other, and option buying carries structural drag from time decay, bid-ask spread, and transaction costs. A >75% win rate at 1:2 reward:risk on buying is not realistically achievable and is internally inconsistent with a 15–25% target. Accordingly, **no strategy here is rated VERY HIGH**. The route to the target is positive expectancy from the higher-confidence core, run through a regime classifier so only setups suited to the current day type are traded, with strict per-trade risk, a daily loss limit, tight cost control, and profit sweeps. For context, SEBI's FY25 study found roughly 91% of individual derivatives traders made net losses; this portfolio's controls are designed to fight that base rate, not to defeat it with certainty.

Confidence distribution across the 15 strategies

0 VERY HIGH	**4** HIGH	**9** NORMAL	**2** LOW

How to read each strategy page

Each of the following pages covers one strategy. **Win probability** is given for both a High-Win profile (smaller targets, higher hit rate) and a High-RR profile (1:2-type targets, lower hit rate), each with its risk:reward. The **confidence interval** is the estimated win-rate range and must be confirmed on the operator's own backtest with real costs — it is an engineering estimate, not a measured statistic. The **confidence level** (VERY HIGH / HIGH / NORMAL / LOW) is a qualitative judgement of how durable the edge is after costs. A short note explains the setup and its main risk.

Disclaimer: This document is engineering material, not investment advice, and its author is not a SEBI-registered advisor. These leveraged-derivative strategies put capital at risk; losses can be total on any position. Confirm and comply with all current SEBI, exchange, and broker requirements for automated retail trading before deploying live capital.

S1 — Opening Range Breakout (ORB-15)

Family	Vehicle	Timeframe	Best regime
Trend-momentum	Nifty weekly ATM	5-min	Trend day

Win probability — High-Win profile	~55% (risk : reward 1:1.3)
Win probability — High-RR profile	~44% (risk : reward 1:2)
Estimated confidence interval (win rate)	42% – 58%
Confidence level	**NORMAL**

Strategy note

Trades the breakout of the first 15-minute range in the direction of momentum, filtered by volume. Clean and mechanical, but the win rate is moderate and false breakouts on range-bound days are the main drag, so it should run only when the regime classifier flags a trend day.

S2 — VWAP Reclaim Momentum

Family	Vehicle	Timeframe	Best regime
Trend-momentum	Nifty weekly ATM	5-min	Trend day

Win probability — High-Win profile	~55% (risk : reward 1:1.3)
Win probability — High-RR profile	~45% (risk : reward 1:2)
Estimated confidence interval (win rate)	43% – 58%
Confidence level	**NORMAL**

Strategy note

Enters on a pullback that reclaims VWAP in the prevailing trend direction with rising volume. A high-quality trend-continuation entry whose edge decays on choppy days, so a trend filter is essential.

S3 — 9 / 20 EMA Pullback

Family	Vehicle	Timeframe	Best regime
Trend-momentum	Nifty weekly ATM	5-min	Trend day

Win probability — High-Win profile	~54% (risk : reward 1:1.4)
Win probability — High-RR profile	~44% (risk : reward 1:2)
Estimated confidence interval (win rate)	42% – 57%
Confidence level	**NORMAL**

Strategy note

Buys pullbacks to the 9-EMA inside an established 9-over-20 EMA trend. Simple and robust on trending sessions; whipsaws during consolidation are the primary failure mode.

S4 — Supertrend + ADX Momentum

Family	Vehicle	Timeframe	Best regime
Trend-momentum	Nifty / BankNifty slightly-ITM	5-min	Trend day

Win probability — High-Win profile	~56% (risk : reward 1:1.3)
Win probability — High-RR profile	~46% (risk : reward 1:2)
Estimated confidence interval (win rate)	44% – 59%
Confidence level	**NORMAL**

Strategy note

Takes Supertrend flips confirmed by ADX above 20, executed on a slightly in-the-money option to reduce time decay. The ADX filter cuts a lot of chop but cannot remove whipsaw risk entirely.

S5 — Bollinger Squeeze Breakout

Family	Vehicle	Timeframe	Best regime
Volatility breakout	Nifty weekly ATM	5-min	Post-consolidation expansion

Win probability — High-Win profile	~52% (risk : reward 1:1.3)
Win probability — High-RR profile	~40% (risk : reward 1:2.5)
Estimated confidence interval (win rate)	38% – 55%
Confidence level	**NORMAL**

Strategy note

Waits for Bollinger Band width to compress to a multi-bar low, then trades the expansion breakout. Excellent reward when a genuine expansion follows, but a meaningful share of squeezes resolve as false starts, which lowers the win rate.

S6 — CPR Trend-Day Play

Family	Vehicle	Timeframe	Best regime
Volatility / structure	Nifty weekly ATM	5-min + daily	Trend day (narrow CPR)

Win probability — High-Win profile	~55% (risk : reward 1:1.4)
Win probability — High-RR profile	~47% (risk : reward 1:2)
Estimated confidence interval (win rate)	45% – 60%
Confidence level	**HIGH**

Strategy note

Uses a narrow Central Pivot Range relative to prior-day ATR as a trend-day signal, then trades the directional breakout. CPR width is one of the more reliable day-type classifiers available to a retail trader, which is why this earns a HIGH rating.

S7 — Camarilla Pivots

Family	Vehicle	Timeframe	Best regime
Structure	Nifty weekly ATM	5-min + daily	Both (breakout or reversal)

Win probability — High-Win profile	~54% (risk : reward 1:1.3)
Win probability — High-RR profile	~44% (risk : reward 1:2)
Estimated confidence interval (win rate)	42% – 57%
Confidence level	**NORMAL**

Strategy note

Treats the Camarilla H4/L4 levels as breakout triggers and H3/L3 as reversal zones, selecting the appropriate side automatically. Versatile across day types, with performance dependent on clean level interaction.

S8 — Support / Resistance Range Fade

Family	Vehicle	Timeframe	Best regime
Mean-reversion	Nifty weekly ATM	5-min	Range day only

Win probability — High-Win profile	~62% (risk : reward 1:1)
Win probability — High-RR profile	~50% (risk : reward 1:1.7)
Estimated confidence interval (win rate)	48% – 65%
Confidence level	**NORMAL**

Strategy note

Fades rejections at the edges of a confirmed intraday range back toward the middle, giving the highest win rate in the book. The rating is held at NORMAL despite that, because the day a range breaks gives back many wins; a hard stop beyond the range is mandatory.

S9 — RSI(2) Mean-Reversion Bounce

Family	Vehicle	Timeframe	Best regime
Mean-reversion	Nifty weekly ATM	5-min	Range / pullback in trend

Win probability — High-Win profile	~60% (risk : reward 1:1)
Win probability — High-RR profile	~48% (risk : reward 1:1.6)
Estimated confidence interval (win rate)	46% – 63%
Confidence level	**NORMAL**

Strategy note

Buys short-term oversold or overbought extremes (RSI-2) at support and resistance for a quick reversion to the mean. High hit rate with modest targets; tail risk is smaller than a pure range fade but still regime-sensitive.

S10 — Expiry-Day Gamma Scalp (Nifty, Tuesday)

Family	Vehicle	Timeframe	Best regime
Expiry	Nifty weekly ATM	1 – 5-min	Expiry Tuesday, trending hours

Win probability — High-Win profile	~50% (risk : reward 1:1.2)
Win probability — High-RR profile	~40% (risk : reward 1:2.5)
Estimated confidence interval (win rate)	36% – 52%
Confidence level	**LOW**

Strategy note

Captures sharp directional thrusts on Nifty's Tuesday expiry when near-ATM gamma is large, governed by a hard time-stop. Rated LOW because time decay is severe: if the move stalls the premium evaporates quickly, so position size must be small.

S11 — Expiry-Day OTM Momentum Lottery (Nifty, Tuesday)

Family	Vehicle	Timeframe	Best regime
Expiry	Nifty weekly OTM	1 – 5-min	Strongly directional expiry only

Win probability — High-Win profile	— (risk : reward —)
Win probability — High-RR profile	~33% (risk : reward 1:4)
Estimated confidence interval (win rate)	28% – 40%
Confidence level	**LOW**

Strategy note

Buys cheap out-of-the-money options on a strongly directional expiry for an asymmetric, lottery-style payoff. The hit rate is low by design, offset by occasional large winners; only viable with tiny position sizes and a strict attempt cap.

S12 — Directional Debit Spread

Family	Vehicle	Timeframe	Best regime
Debit spread	Nifty / BankNifty vertical	5-min	Trend day

Win probability — High-Win profile	~58% (risk : reward 1:1.3)
Win probability — High-RR profile	~50% (risk : reward 1:1.8)
Estimated confidence interval (win rate)	48% – 60%
Confidence level	**HIGH**

Strategy note

Expresses a directional view as a bull-call or bear-put vertical, where the sold leg hedges time decay and implied-volatility risk and caps the loss at the net debit. This is the best risk-adjusted buying structure in the portfolio and a core HIGH-confidence holding.

S13 — ORB Debit Spread

Family	Vehicle	Timeframe	Best regime
Debit spread	Nifty vertical	5-min	Trend day

Win probability — High-Win profile	~56% (risk : reward 1:1.4)
Win probability — High-RR profile	~47% (risk : reward 1:1.8)
Estimated confidence interval (win rate)	46% – 58%
Confidence level	**HIGH**

Strategy note

The opening-range breakout of Strategy 1 executed as a vertical spread rather than a naked long, materially reducing time-decay and slippage drag. Defined risk plus a robust trigger earns the HIGH rating.

S14 — Mild Diagonal (Nifty only)

Family	Vehicle	Timeframe	Best regime
Spread / calendar	Nifty weekly + next-weekly	5-min + multi-day	Mild trend, low-to-moderate volatility

Win probability — High-Win profile	~55% (risk : reward 1:1.2)
Win probability — High-RR profile	— (risk : reward —)
Estimated confidence interval (win rate)	50% – 58%
Confidence level	**NORMAL**

Strategy note

Holds a slightly in-the-money longer-dated long against a near-dated short to harvest near-term theta while staying net-long-directional. Nifty-only, since Bank Nifty has no weekly expiry, and operationally more complex, hence NORMAL rather than HIGH.

S15 — Regime-Switch Composite (router / overlay)

Family	Vehicle	Timeframe	Best regime
Meta-overlay	Routes to other strategies	Decision at ~09:35	All (the regime selector)

Win probability — High-Win profile	~53% (blended) (risk : reward ~1:1.5)
Win probability — High-RR profile	— (risk : reward —)
Estimated confidence interval (win rate)	50% – 56%
Confidence level	**HIGH**

Strategy note

Not a single setup but the router that classifies the day at about 09:35 and activates only the strategies suited to it: trend, range, or expiry. Regime gating is the single biggest durable edge for a retail option buyer, which is why the overlay itself is rated HIGH.
